

Internet Kiosks from KT installed at Fire Stations throughout Normandy.

KT Case Study

Summary:

The client, which is a governmental body under the department of Ministry of Interior in France, posted a call for proposals for internet kiosks to be installed into local firefighting stations throughout Normandy. Our partner in France, after submitting its proposal, was awarded the tender by the Ministry of Interior in France to deliver a complete internet kiosk solution.

History:

The client is the Ministry of Interior in France, which is responsible for most of the departments nationally of the French Fire stations. The concept was to install, into the Normandy region, a network of internet access kiosk terminals that allowed off-duty firefighters to access the internet onsite, while on call, via one of the X5 kiosk terminals from KT. One of KT's partners submitted its proposal in a call with the Government Ministry and was successfully awarded the tender.

Case:

The project, installed in 2009, was to deliver 50 X5 model KT kiosk terminals for internet access to the region of Normandy, France, to allow on-call personnel to surf the internet using public access internet kiosks at the fire station. Our partner delivered this with basic X5 kiosk terminals, which had a kiosk browser software app loaded on them, which allowed for easy use to gain access to the internet. When not in use by those living at the fire station, while on-call, the X5 kiosk terminals were to display information relating to the fire department and services that visitors could access while they were on site at local fire stations.
